

# GRANTHIK SOM

Flutter Developer | Dart | Cross-Platform Mobile Applications

Jaipur, Rajasthan, India | +91 7908490678 | [granthiksom@gmail.com](mailto:granthiksom@gmail.com) | [github.com/GranthikSom](https://github.com/GranthikSom) | [Portfolio](#)

---

## SUMMARY

---

Flutter developer with a strong record of shipping complete, working cross-platform applications built with Dart, Provider, and BLoC. Experienced across the full mobile development lifecycle -- UI design, third-party SDK integration (Google Maps, audio playback, device camera), state management, and Clean Architecture -- with a working knowledge of backend API development using Dart Frog. Comfortable owning a project end-to-end, from architecture through a functioning, demoable build.

## TECHNICAL SKILLS

---

**Languages:** Dart (primary), Python, C

**Frameworks:** Flutter (Android, iOS, Web), Dart Frog

**State Management:** Provider, BLoC / Cubit, GetX

**Backend & APIs:** REST APIs, JWT authentication, Firebase (Auth, Firestore, Storage), JSON persistence

**Testing:** flutter\_test (unit & widget tests), Mockito

**Tools & Practices:** Git, GitHub, GitHub Actions (CI/CD), Clean Architecture, Repository Pattern, Android Studio, VS Code

## PROJECTS

---

**Sedo -- Motorcycle Dashboard Application** | *Flutter, Dart, Provider, Google Maps SDK, audioplayers, image\_picker*

Repository: [github.com/GranthikSom/sedo](https://github.com/GranthikSom/sedo)

- Shipped a complete, working 6-screen rider companion app that runs live on a physical test device, integrating GPS navigation, a digital speedometer, audio playback, and camera capture into a single dashboard -- replacing the need for 3+ separate apps while riding.
- Integrated **google\_maps\_flutter** and **audioplayers** SDKs through clean service-layer abstractions, keeping third-party dependencies fully decoupled from the UI layer.
- Implemented **Provider**-based state management across theme (light/dark), playlist, and navigation state, keeping all 6 screens reactive with no setState calls in business logic.
- Organized the codebase into discrete layers (pages/, service/, models/, themes/) following Clean Architecture principles, producing a structure that a new contributor can navigate without a walkthrough.

**Musix -- Full-Stack Music Streaming Platform** | *Flutter, Dart, Dart Frog, Provider, JWT, audio\_service*

Repository: [github.com/GranthikSom/musix](https://github.com/GranthikSom/musix)

- Designed and built a full-stack music streaming platform: a Flutter client plus a self-built **Dart Frog** backend exposing REST endpoints for authentication, songs, playlists, favorites, and file uploads.
- Implemented JWT-based authentication with bcrypt password hashing, and CRUD APIs for songs and playlists backed by JSON persistence.
- Built a local-file scanner that indexes on-device audio in the Flutter client by offloading I/O to a background isolate, keeping the UI thread free during library scans.
- Structured the client with a dedicated service layer separating playback state from the widget tree, and maintained a 50-commit history with a feature-branch workflow suited for code review.

## EDUCATION

---

**B.Tech, Computer Science & Engineering** -- University of Engineering & Management (UEM), Jaipur

*Expected July 2027*

Relevant coursework: Data Structures & Algorithms, Object-Oriented Programming, Operating Systems, Software Engineering
